

Quickly Locate Video Evidence

The time-saving Museum Search feature in ViconNet allows post recording, ultra-fast search to quickly sort through large amounts of video to find exactly what you need. It enables you to locate a specific camera's video segments within a defined time interval, saving you from having to review the entire storage database.

This powerful forensic tool allows you to target all the video segments that contain specific actions or events, for example, the opening of a window, a door opening, a car being moved, or when an item disappears from a scene.

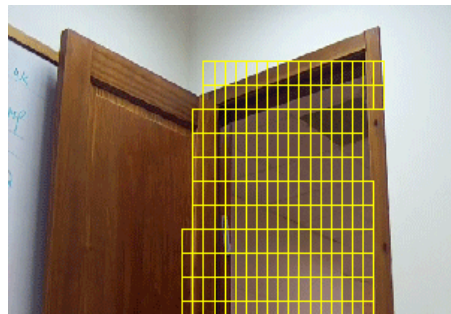

NOW available with IQeye cameras and ViconNet 8.1

Detect changes in video to determine unique events during a specific timeframe.

Museum Search Features

▶ Smart Search

Save time and money with this powerful forensic search feature.

▶ Easy to Configure

Just a few mouse clicks and you can identify the camera's recording timeframe and regions of interest.

▶ Now Compatible with all IQeye Cameras

Previously only working with ViconNet-based devices (Kollector DVRs, encoders and IP cameras), museum search is now available with many of our IQeye cameras (requires ViconNet 8.1 and current camera firmware).
