

SALES ALERT

Introducing VAX 2.10

Upgrade your security operation with the latest release of VAX Access Control. In this version, you can access a deep integration with Valerius, streamline notifications and migrate data easier than ever before.

Meet VAX 2.10

VAX Access Control streamlines solutions to provide real-time awareness and protection of your property. That's why this release focuses on enhancing useability and monitoring, improving reaction times and streamlining a seamless interface between VAX and our Valerius Video Management System (VMS).

What you can expect

These most recent updates provide scalable customizations, offering the opportunity to tailor how you interact with your system so you can focus on what's most important.

You can better centralize your video surveillance and access control with a deeper Valerius integration for your day-to-day monitoring and alarm management.

If you prefer to use the VAX interface, we've made several improvements for notification customizations, so you can focus on what matters most. Now you can customize which notifications you see and how they appear. We've also added desktop push notifications so you'll be notified of events even when you're not actively monitoring VAX.

Additionally, we've made migrating to new partitions easier and faster than ever before. With our new tool, you can migrate doors, users, crisis levels, and more with just a few clicks.

Read on to see how this latest version of VAX will help you centralize your systems and make your operation more efficient.

Key Benefits

Centralize your access control and video surveillance through Valerius VMS

Focus on what matters most with notification customization

Migrate and expand new sites in a fraction of the time

Centralize your access control and video surveillance monitoring

Unleash the power of a deeper VAX and Valerus VMS integration with a centralized management of alerts and notifications, directly from the Valerus interface. This ensures operators can see a full picture of their access control and video surveillance all from a single interface. No need to swivel between screens and windows to find active alarms and alerts—you can view it all in one place.

See and respond to all your alarms in one place

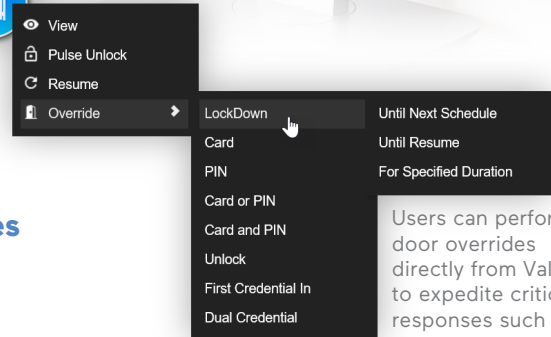

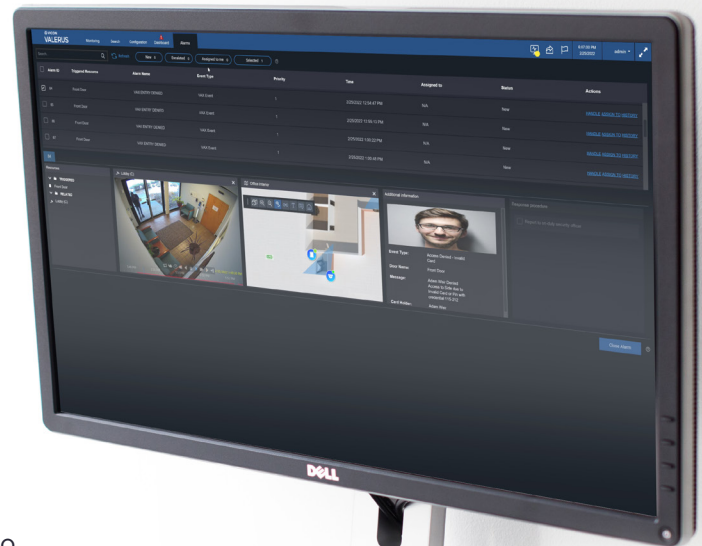

Integrate VAX events into the Valerus Alarm Management Suite for faster reaction times and a better way to uncover, respond to, and document VAX events and associated video.

React faster with door overrides in Valerus

You can quickly enable door overrides directly from the Valerus map, which will speed reaction time if you catch something on-screen.

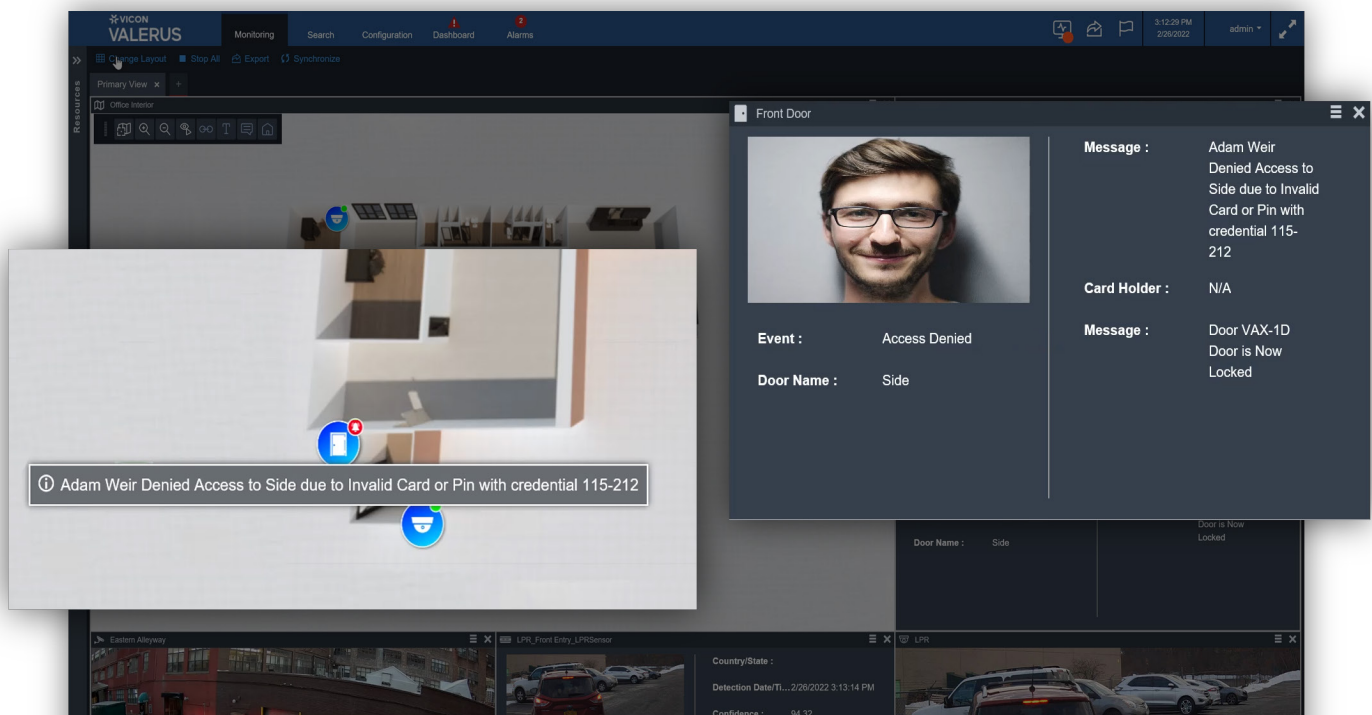

See the full picture with Valerus map and live event tiles

You can see alerts, door state, door notifications and access notifications right from your Valerus maps for an all inclusive view of your facilities. It also makes bookmarking VAX events in the corresponding video feed faster and easier than ever before.

Users can perform door overrides directly from Valerus to expedite critical responses such as lockdowns.

From Valerus' monitoring interface, users can see VAX events in real time for immediate visual verification and reactions.

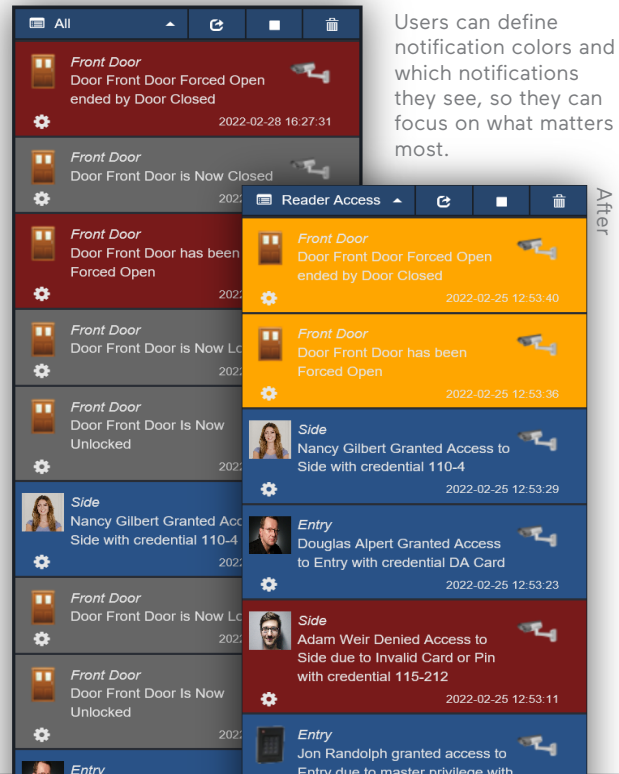

Make your notifications count with extensive customization

Configure and enable the event notifications you want and need to see first. Rather than sifting through dozens of irrelevant alerts, users can now customize the types of notifications that appear, enabling proactive decision-making within the traditional VAX interface. Users can now customize different views for different operators, so they can solely focus on information relevant to them. This helps filter out extraneous information and swiftly respond to alerts that otherwise might have gone unnoticed.

Taking it a step further, users can customize a notification's color and audible tone for immediate confirmation if it's a priority, see live video of certain events and control how notifications are handled based upon the level of urgency.

Before

Add new access control sites in minutes

Expanding and adding new access control sites can sound overwhelming and time consuming. However, our new data migrator tool allows you to easily duplicate specific site information and apply it to another.

Since you don't need to re-enter the same information, you can focus on mission-critical details required during transitions and expansions. This is ideal for enterprise customers who are expanding, or for anyone who is moving to a new location.

ExportImport

Step 1: Partitions To Export

Partitions☐ Default Partition

Step 2: Options To Export

Options

Option	Description
<input checked="" type="checkbox"/> All	All of the options shown below
<input type="checkbox"/> Crisis Levels	Crisis Levels
<input type="checkbox"/> Users	User records, Credentials, Custom Fields, and Access Group memberships
<input type="checkbox"/> Access Groups	Access Groups, reader assignment and floor assignment
<input type="checkbox"/> Devices And Scheduling	Panels, doors, elevators and associated scheduling
<input type="checkbox"/> Holidays	Holidays
<input type="checkbox"/> OTRs	One Time Run Time Zones
<input type="checkbox"/> Cameras	Camera Integrators and Cameras
<input type="checkbox"/> Action Plans	Action Plans and Action Triggers

*Notifications, logs, profile pictures, templates, maps and administrators are not exportable.

Export

Migrating sites is now as simple as a few clicks.

Receive real-time push notifications so you'll never miss a critical event

Using web pushes, stakeholders can receive high-priority notifications even when they're multi-tasking or not currently logged into VAX. These notifications are customizable by System Admins, so you can ensure the right people get the right notifications.

For this feature, your system must be connected to the internet. It's supported by Chrome®, Safari® and Firefox®, which (combined) represent about 77% of the web browser options.

OSDP protocol protects your most critical information

For those seeking advanced security protection, the new Open Supervised Device Protocol (OSDP) support enables a reliable and secure connection between access control system readers and door controllers. OSDP encryption increases security and provides peace-of-mind for any surveillance operation by eliminating the risk of "man-in-the-middle" attacks.

This feature improves your access control system with end-to-end encryption and is ideal for applications such as government locations that mandate compliance with specific federal access control directives.

Additional new features

Database usage indicator

Set up an alarm to notify you when a specific percentage (user-definable) of the 10GB database has been depleted.

New triggers and actions

Choose from a variety of new access control conditions (e.g., door override, door prevented from unlocking, and panel updated) and resulting actions (e.g., purge notifications, enable/disable trigger, and run action plan).

"Lock" status on door strikes

The on-screen overview and VAX maps show the real-time status of the various door strike outputs (locked/unlocked).

Get desktop notifications even when you're not actively monitoring VAX.

OSDP support is ideal for applications requiring additional security like government facilities.
